<p>STATUS: In May 1988, a citizen contacted IDEM regarding a chemical taste in the drinking water at the Post Office in Clayton. IDEM sampled the water and detected the presence of tetrachloroethylene (PCE). IDEM collected an additional 28 well samples to determine the nature and extent of the contamination. IDEM installed water filters and continues to periodically samples the wells. The concentration of the groundwater contamination has steadily decreased over time and is now approaching the cleanup level.</p>
